**BEFORE THE BOARD OF PATENT APPEALS  
AND INTERFERENCES**

Application Number: 10/785,391  
Filing Date: February 24, 2004  
Appellant(s): BASS, RAYMOND

**MAILED**  
**NOV 24 2006**  
**Group 3700**

Li-Chung Daniel Ho  
For Appellant

**EXAMINER'S ANSWER**

This is in response to the appeal brief filed 9-8-2006 appealing from the Office action  
mailed 1-10-2006.

**(1) Real Party in Interest**

A statement identifying by name the real party in interest is contained in the brief.

**(2) Related Appeals and Interferences**

The examiner is not aware of any related appeals, interferences, or judicial proceedings which will directly affect or be directly affected by or have a bearing on the Board's decision in the pending appeal.

**(3) Status of Claims**

The statement of the status of claims contained in the brief is correct.

**(4) Status of Amendments After Final**

The appellant's statement of the status of amendments after final rejection contained in the brief is correct.

**(5) Summary of Claimed Subject Matter**

The summary of claimed subject matter contained in the brief is correct.

**(6) Grounds of Rejection to be Reviewed on Appeal**

The appellant's statement of the grounds of rejection to be reviewed on appeal is correct.

**(7) Claims Appendix**

The copy of the appealed claims contained in the Appendix to the brief is correct.

**(8) Evidence Relied Upon**

5,660,753	LINGNAU	8-1997
5,837,976	LOVELESS et al	11-1998

**(9) Grounds of Rejection**

The following ground(s) of rejection are applicable to the appealed claims:

Claims 1-3 and 5-10 are rejected under 35 U.S.C. 103(a) as being unpatentable over Lingnau (US 5,660,753), in view of Loveless et al (US 5,837,976).

Lingnau discloses the claimed invention of an induction heating stripping device for removing coating bonded to a metal surface including an electrical power supply 14, electrical leads 22 and stripping head 20. It does not explicitly show the circuit of the power supply with the use of capacitors (see Figures 1, 2 and 4 and col. 2, line 38 - col. 5, line 45). However, Loveless shows that it is well known in the art of induction heating devices that it is essential to use capacitors to form a resonance circuit with the heating inductor to induce current to the work load to provide induction heating. It shows the use of a capacitor 92, 94 between each lead to the power supply 86 and each lead to the inductor 96 forming series resonant circuits. The

Art Unit: 3742

capacitors 92 and 94 are clearly spaced from the inverter 86 by the transformer 88 and the lead wires and definitely the commercial power source (see Figures 4B, 5 and 8 and col. 4, line 66 – col. 5, line 65). It would have been obvious to one having ordinary skill in the art at the time the invention was made to modify Lingnau to include capacitors in order to form a series resonant tank circuit with the heating inductor to produce induction heating at resonance for better heating efficiency and result, in view of the teaching of Loveless. In regard to claim 6, Lingnau uses a 75-100 KW, 10 KHz frequency and 480 volts (see the abstract and col. 4, lines 1-6). The use of a lower wattage power supply for smaller jobs in order to lower cost would have been an obvious choice. In regard to claim 7, the exact value of the capacitors would be a matter of engineering design depending on the values of the operating frequency and the inductance of the induction heating coil (84, 96) in order to form a resonance circuit according to the formula (see Loveless, col. 5, lines 35-43). In regard to claims 8-10, the length of the cables would have been a matter of engineering expediency depending on the overall load characteristics and the available cost. Although the length of the cables 22 in Lingnau has not been disclosed, it would be obvious to an ordinary artisan the cable length would depend on the relative distance between the job site and the power supply. More importantly, since there is no criticality or reason on why and how such parameters are chosen provided in the specification, therefore, they are only seen as an operating example that can be easily determined by an ordinary artisan through routine experimentation.

**(10) Response to Argument**

Applicant's arguments filed 10-26-2005 have been fully considered but they are not persuasive. The argument that Loveless (US 5,837,976) does not disclose capacitors "spaced from the power supply" is not well taken. At the outset, all that required is "an electrical power supply" without any specifics on the power supply. It is submitted that "an electrical power supply" may be merely the commercial power source which of course, spaced from all the electrical devices using the power source. Furthermore, even if the capacitors 92, 94 and the voltage inverter 86 (commonly known as the claimed power supply) as shown in Figure 4b are in a single housing, they are still spaced and separated from each other by the transformer 88 and the wires. In regard to claims 8-10, the appellant has not provided any reason or criticality in the specification or the argument for the use of the claimed cable lengths and the length ratio (25%). It is therefore, respectfully submitted that it is a mere matter of engineering expediency to determine the relative location of the electrical elements between the power supply and the other electrical elements depending on the types of heating application.

**(11) Related Proceeding(s) Appendix**

No decision rendered by a court or the Board is identified by the examiner in the Related Appeals and Interferences section of this examiner's answer.

Art Unit: 3742

For the above reasons, it is believed that the rejections should be sustained.

Respectfully submitted,

  
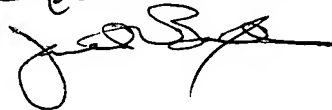

Philip H. Leung  
Primary Examiner  
Group Art Unit 3742
